Professional Summary

I am a BS Software Engineering student with practical full-stack development skills across React, Next, PHP, and Laravel. I am hardworking, honest about what I know and what I am still learning, and genuinely passionate about building things that work well. Eager to bring my knowledge and skills into an internship environment where I can contribute in industrial projects and grow under professional guidance.

Education

Bachelor of Software Engineering

COMSATS University Islamabad, Wah Campus

Current Semester: 7th

Expected Graduation: June 2027

CGPA: 3.24 / 4.00

Technical Skills

Frontend : HTML, CSS, JS, Bootstrap, React, Next

Backend : PHP, Laravel, C++, java

Database: MySQL, PostgreSQL, Prisma

Other : Git, Github, Dart, Flutter, VS Code, Jira, Zephyr, Copilot, Cursor, Antigravity

Projects

Luggage Transport Management System (HTML, CSS, JS, PHP/Laravel)

- Developed a full-stack Laravel-based web application with login /signup authentication.
- Created separate Admin and User dashboards with complete CRUD functionality.
- Built a responsive frontend using HTML, CSS, JavaScript, and Bootstrap.
- Managed database operations using MySQL.

Expenso – Expense Tracker (React, Next, Tailwind)

- Architected a scalable Expense Tracker using Next.js (App Router), implementing nested layouts and route groups for clean, production-grade frontend architecture.

- Engineered global state management with the Context API, eliminating prop-drilling while managing complex user authentication and financial data.
- Developed a custom `useLocalStorage` hook for efficient state persistence, demonstrating advanced proficiency in React hooks and browser-side data handling.
- Optimized performance for real-time analytics by leveraging `useMemo` and `useCallback`, ensuring smooth data rendering for interactive charts and dashboards.

FIFA 23 Market Value Prediction (python, numpy, pandas, ML)

- Developed a Machine Learning-driven prediction model to estimate football player market values using the FIFA 23 dataset, achieving a 99.1% R2 accuracy score.
- Engineered an end-to-end data pipeline involving rigorous preprocessing—handling 2,057 outliers, removing duplicates, and applying `StandardScaler` to optimize model performance.
- Performed Exploratory Data Analysis (EDA) using heatmaps, boxplots, and histograms to identify strong feature correlations, specifically highlighting "Overall" and "Potential" ratings as primary valuation drivers.
- Deployed an interactive web application using Streamlit, enabling end-users to input player attributes and receive real-time market value predictions via a serialized Random Forest model.
